CAREER OBJECTIVE

Aspiring Network Operations Engineer with a strong interest in networking, technical support, and digital platform operations. Passionate about troubleshooting network-related issues, monitoring systems, and ensuring reliable communication across distributed platforms. Skilled in analytical problem-solving, networking fundamentals, and system operations, with a strong willingness to learn network operations tools, ticketing systems, and enterprise support workflows in a fast-paced technology environment.

SKILLS

Network Protocols: TCP/IP, DNS, DHCP, HTTP/HTTPS, VPN, Routing & Switching

Network Operations & Monitoring: Network Troubleshooting, Incident Handling, SolarWinds

Tools & Platforms: Jira, Confluence, GitHub

System & Infrastructure Management: Operating Systems, Network Security Basics

Database Knowledge: MySQL

Soft Skills: Teamwork, Ability to troubleshoot, Problem solving

PROJECTS

MAIN PROJECT -:

G-One – Distributed AI Automation & Network Operations System - Developed a distributed multi-agent automation platform during a Vodafone Idea Limited–Edunet Foundation internship, focused on scalable infrastructure management, intelligent service orchestration, and reliable system operations. Implemented multi-provider API routing with automatic failover mechanisms to maintain uninterrupted service availability during endpoint failures and rate-limiting scenarios. Designed health monitoring, centralized logging, and service availability checks for proactive fault detection and operational visibility across distributed services.

Worked on containerized deployment and cloud infrastructure management using Docker and AWS ECS, including CI/CD pipeline automation, deployment orchestration, and performance optimization for scalable workloads. Managed MongoDB Atlas connectivity through connection pooling, DNS resolution handling, and timeout optimization to improve network efficiency and reliability. Integrated WebRTC-based real-time communication and implemented application-layer security mechanisms such as HTTP security headers, rate limiting, traffic management, and secure request validation to enhance operational stability and system security.
